Accessory Products

Air Thread Pusher

To increase output on your bagging line and maximize your packaging dollars, the Fischbein A1725 air thread pusher allows for automatic thread cutting without the assistance of an operator. While the thread pusher directs the thread into the cutting knives, the operator is free to concentrate on filling and closing the next bag.

Coders

Fischbein offers the latest in coding technology for your complete bag closing needs.

The 5300 Indexing Coders are used for coding paper bags with font sizes ranging up to 1 inch.

The Lincoln TC-50 Coder is used to randomly print on crepe tape before it is applied to the bag.

For more sophisticated marking, the Marsh Ink Jet Printer can be attached to all Fischbein bag closing systems. Contact Huntsman, Inc. for more information.

Infeeds

To increase production rates and decrease operator fatigue, a Fischbein power infeed is for you. A 1/4 horsepower motor drives a set of belts which feed the bag into the sewing head. The operator simply feeds the leading edge of the bag into the infeed, allowing free hands to begin preparing the next bag.

The model 4380 is used for plain sewn bags. For tape sewing, the model 2700 will feed the bag, trim the bag top and apply crepe tape to the bag. For small tape sewn bags (10 lbs. and under), the model 2850 is an option if reduced free board is necessary.

Photoelectrics

Fischbein offers state of the art photoelectric eyes to start and stop your sewing system. These eyes eliminate the need for mechanical fingers and wands. Instead, a beam of light, interrupted by passing bags, signals the system to start.

For plain sewing, the A1790 is used (with a power infeed only)

For tape sewing, the 16150 signals proper tape clipping as well as sewing head controls.

Detectors

Are you concerned with costly downtime on your sewing line? If so, the Fischbein 16000 series of detectors is the answer. These detectors automatically sense movement of thread, tape and low oil pressure while your sewing system is running. If there is no thread or tape movement past the sensors, your system automatically shuts down. This eliminates lost bagging production due to improperly closed bags and allows for a totally automated sewing line.

Pull Tape Attachment

For an attractive, easy open bag, try the Fischbein A6252 pull tape attachment. This easy-to-install feature is used with the single thread Fischbein heavy duty tape sewing head. The attachment feeds a 3/8 inch wide strip of pull-tape into the sewing head where it is sewn together with the crepe tape on the bag. The paper strip is then pulled for an easily opened bag top.

Needles

Only Fischbein sewing needles should be used with Fischbein heavy-duty sewing machines. The curved C100-S needle is used with the Fischbein heavy-duty sewing heads. The C80-S, a smaller version of the C100-S, is also available and produces smaller needle holes for less product leakage.

Lubricants

Fischbein lubricants are the only choice for use with your Fischbein equipment and accessories. Fischbein's unique 10200 Lubricating Oil, designed only for use in your sewing machine, internally coats all moving parts and adds years to the life of your machine. It's essential for the proper maintenance of your 90/91 Fischbein heavy-duty sewing head. Our 10200 Lubricating Oil provides superior and residual-free lubrication. The solution to sewing problems usually associated with heavy or non-skid coated bags, our 5-102 Thread Lubricant might just be your cure-all.

Sewing Thread

Designed specifically for use with industrial sewing equipment, Fischbein Premium Synthetic Thread and Fischbein 100% Polyester Thread provide you with the strength, assurance and choice you're looking for. To maximize product integrity and sewing output, Fischbein Premium Synthetic Thread is your perfect choice. And if you're looking for a generic, low cost thread, try Fischbein 100% Polyester Thread. Available in a wide variety of sizes, Fischbein offers both threads in 8 ounce, 2 1/2 pound, 5 pound and 20 pound cones.
